Registered Testing Authority - Building Code of Australia

5 October 2007 Our Ref. EN13 / 298.2 03/0212

TEST REPORT No. 4109s

Requested by: Tarkett Australia on (date): 28 September 2007

Manufacturer: Tarkett

Product Desc.: Safetred Universal Plus - Vinyl sheet

1000 x 500mm

Sampling details:

Where: Delivered

Date: 3 October 2007

By whom: Courier How (methods): N/A

The results reported relate only to the sample(s) tested and the information received. No responsibility is taken for the accuracy of the sampling unless it is done under our own supervision. CSIRO cannot accept responsibility for deviations in the manufactured quality and performance of the product. While CSIRO takes care in preparing the reports it provides to clients, it does not warrant that the information in this particular report will be free of errors or omissions or that it will be suitable for the client's purposes. CSIRO will not be responsible for the results of any actions taken by the client or any other person on the basis of the information contained in the report or any opinions expressed in it. The reproduction of this test report is only authorised in the form of a complete photographic facsimile. Our written approval is necessary for any partial reproduction.

This test report consists of 4 pages

	SUMMARY OF SLIP RESISTANCE I	ESTS PERFORMED	:	
			Result	Class
AS/NZS 4586:2004	Slip resistance classification of new pedes	strian surface materia	ls	
	Appendix A: WET Pendulum (Four S s	lider):		
		Mean BPN:	65	V
AS/NZS 4586:2004	Slip resistance classification of new pedes	strian surface materia	ls,	
	Annendiy D. Oll -WET Ramp			

Appendix D: OIL-WET Ramp

Mean overall acceptance angle: 31.9° R 12

In order to interpret the classifications, please refer to Standards Australia Handbook 197, An Introductory Guide to the Slip Resistance of Pedestrian Surface Materials, which recommends minimum classifications for a wide variety of locations.

It is important to realise that test results obtained on unused factory-fresh samples may not be directly applicable in service, where proprietary surface coatings, contamination, wear and subsequent cleaning all influence the behaviour of the pedestrian surface.

SLIP RESISTANCE CLASSIFICATION OF NEW PEDESTRIAN SURFACE MATERIALS

WET PENDULUM TEST METHOD

TEST CARRIED OUT IN ACCORDANCE WITH

AS/NZS 4586:2004 (Appendix A)

Test Date: 4 October 2007

RESULTS:

Location:

Slip Resistance Laboratory

Rubber slider used: Four S

Conditioned with grade P400 paper, dry

Sample: Cleaning: Unfixed Acetone

23°C Temperature:

Pendulum Friction Tester: Munro-Stanley (S/N: 0312, calibrated 01/03/07)

Test conducted by: Peter Westgate

	Specimen 1	2	3	4	5
Last 3 swings	66 66 66	66 66 66	65 65 65	65 64 64	63 62 61
Averages	66	66	65	64	62

Mean BPN: 65

CLASS:

Where products are to be used in wet barefoot areas, it is more appropriate to test to Appendix C of AS/NZS 4586 (which is technically equivalent to DIN 51097).

DETERMINATION OF RZ SURFACE ROUGHNESS

(Using a Taylor-Hobson Surtronic Duo roughness meter using a 0.8mm cut off length)

Test Date: 4 October 2007

RESULTS

Location: Slip Resistance Laboratory

	Rz values
1	36.3
2	38.5
3	31.5
4	15.6
5	40.9
6	12.9
7	42.0
8	14.2
9	14.6
10	16.7

Surface Roughness (Rz) mean = 26.3 microns

BS 7976:2002, Pendulum Testers, requires a different test foot preparation (lapping paper) for pedestrian surfaces that have a Rz roughness of less than 15 microns. This lapping paper tends to reduce the pendulum result, sometimes appreciably. CSIRO recommends the use of this procedure (CSIRO COF1) as an adjunct to AS/NZS 4586. It helps to discriminate among products that have marginal wet slip resistance and to identify those that may be dangerous if wet.

The measurement of the various aspects of surface roughness is complex given the number of potential roughness parameters. While there is still some uncertainty as to exactly what type of roughness needs to be measured, peak-to-trough roughness (Rz) gives a useful guide to the likely slip resistance in wet conditions. Research has suggested that hard floors need to have a slightly higher Rz roughness than polymeric floors for the same degree of safety in wet conditions, but whatever flooring material is used an Rz roughness value of at least 10 microns is required where wet slip resistance may be required. In circumstances where wetness is normal or expected, this figure should be increased by a factor of 2 or more.

Greater peak surface roughnesses are likely to be required where floors slope or where the floor is likely to become contaminated with high viscosity liquids.
